

***Himantoglossum hircinum* (L.) Spreng. Lizard Orchid**

Native

GB & England: Least Concern

Schedule 8

GB Scarce

VC5 Absent; VC6 Rare

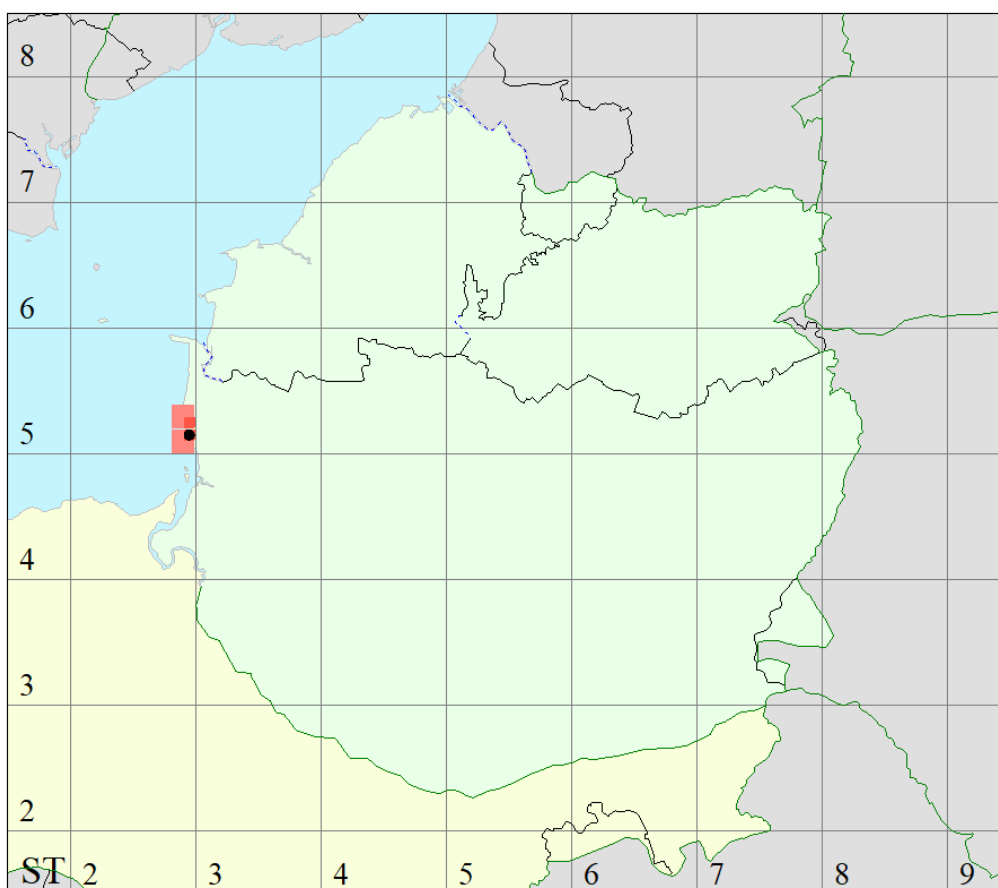

A tuberous wintergreen perennial orchid found on calcareous grassland, verges, quarries and dunes. First found in Somerset by Miss Stewart in 1923, on an artificial bank in the grounds of a derelict building, at Burnham-on-Sea. In 1924, J.W. White counted 84 plants at this site. Seen on the dunes between Burnham and Berrow a few times during the 1930s and 1940s (see Green *et al.*, 1997), and by E.F. Payne in 1951, after which none were recorded for forty years. Rediscovered in 1991 when eight rosettes were found on the golf course at Berrow by Ian Green. Plants were seen in the 1990s by Miss C.M. Saunders in a different part of the dunes, but are now known only around the site found in 1991, where numbers have increased considerably, with 130 seen in 2001 and 259 rosettes counted in 2009. Although this is the only current site in Somerset, this species has made sporadic appearances elsewhere in VC6: found in about 1956 by A.H. Turner in a copse near Penselwood; appeared in a garden in Charlton Adam in 1975, where it persisted for two seasons; and flowered in 1978, apparently wild, in gardens in Tickenham and Clapton-in-Gordano. In England, *Himantoglossum hircinum* is at the northern limit of its range; the site in Somerset is at the western edge of its current distribution in England.
